

Environmental activities carried out by SATECMA

SATECMA, from the beginning of its activities in 1976, has been developing a continuous effort in order to preserve the environment. This effort got its reward at the end of 1999 with the Certification according to the standard UNE-EN-ISO 14001, informing our suppliers at this very moment. Besides, in 2005 SATECMA has adapted its Environmental System to the standard UNE-UN-ISO 14001:2004. At the same time, over the years we have started different projects related to the environment, among which we can mention the following:

- Building of a water treatment plant for physico-chemical treating the effluents generated in the factory.
- Building of a collection box to control liquid effluents.
- Internal and external controls of the waste water.
- Construction of retention tanks for preventing possible spillage in deposits and outside storage areas.
- Treatment of wastes, both hazardous and non-hazardous.
- Limiting of a covered area for storage of hazardous wastes.
- Building of a high security room for storing hazardous products.
- Permanent natural ventilation in the area where paints are manufactured.
- Installation of a fume removal hood in the room for paint mixing.
- Conditioning of shells for storing chemicals, with earth connections.
- Buying of a machine for compacting metal containers.
- Buying of a crushing machine for plastics.
- Buying of an equipment for regenerating solvents.

After all this, SATECMA has shown that apart from being a leading company in its field of activity, it also has a permanent concern for the Environment, which leads us to innovate day after day and to try and improve continuously in order to preserve as much as possible the natural environment, in this process of continuous improvement which is our basic acting principle.
